

(a) Measurement

(b) Adaptive acquisition

(c) Prediction

Training

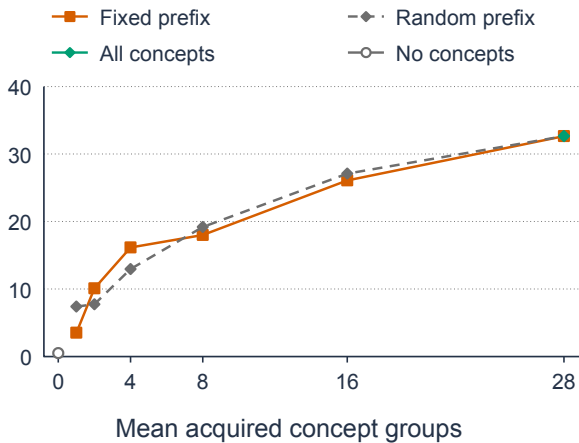

Public labels + cross-fitted responses

--> Error / signed loss reduction

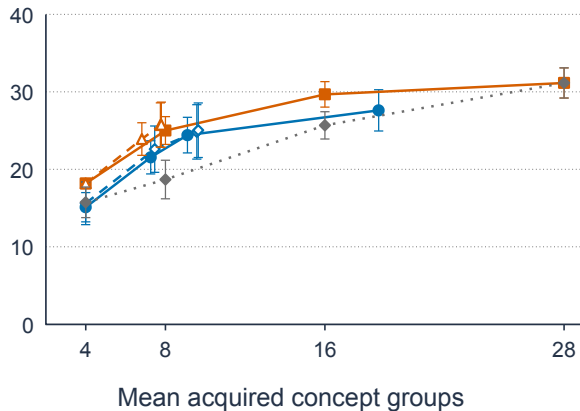

--> Fit controller

Declared cost controls acquisition; actual cost is logged externally.

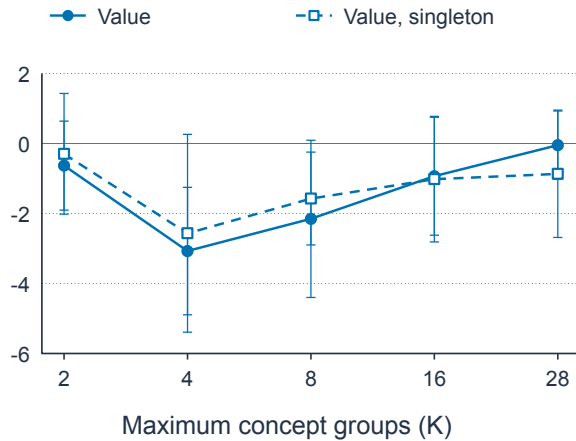

Validation accuracy (%)

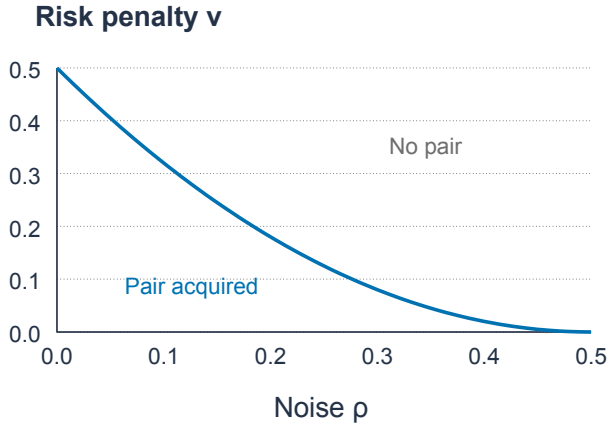

Validation accuracy (%)

Accuracy difference (pp)

Analytical illustration

$$v = (1 - 2p)^2 / 2$$

Independent symmetric flips

Bayes task head

Static pair = pair-aware adaptive

Equal Bayes performance in this construction.

v is a risk penalty, not milliseconds.
