

(a) Measurement

(b) Adaptive acquisition

(c) Prediction

Training

Public labels + cross-fitted responses

-> Error / signed loss reduction

--> Fit controller

Declared costs guide actions. Actual costs are logged separately.

Validation accuracy (%)

Validation accuracy (%)

Accuracy difference (pp)

Analytical illustration

$$v = (1 - 2\rho)^2 / 2$$

Independent symmetric flips

Bayes task head

Static pair = pair-aware adaptive

Equal Bayes performance in this construction.

v is a risk penalty, not milliseconds.
